Task Manager FAQ

Overview

This FAQ guide is designed to help users understand how to use and troubleshoot the Task Manager command-line application.

Intended Users:
Beginner to intermediate-level developers who are learning to work with CLI-based programs.

Getting Started

Q: How do I install the project?
A: Download or clone the project repository and make sure **Python version 3.11 or higher** is installed. No extra libraries or dependencies are needed.

Q: How do I add a new task?
A: Use the following command:

```
python cli.py create "Task Title"
```

Features and Functionality

Q: How can I assign a priority to a task?
A: Use the **--priority** option with the following values:

- **--priority 1** → Low
- **--priority 2** → Medium
- **--priority 3** → High
- **--priority 4** → Urgent

Q: How do I filter tasks?
A: You can filter tasks by their status or priority level using commands such as:

```
python cli.py list --status todo
python cli.py list --priority 3
```

Q: Where is task data saved?
A: All task information is stored locally in a **JSON file named tasks.json**.

Troubleshooting

Q: Why isn't my task updating?
A: Confirm that you are entering the correct **task ID** when attempting to update a task.

Q: Why am I seeing a date format error?
A: Make sure dates are entered using the correct format:
YYYY-MM-DD

Q: Why aren't any tasks appearing?
A: This usually means no tasks have been created yet. Run the **create** command first to add tasks.

Additional Questions

Q: Can this project be expanded with new features?
A: Yes, the project can be enhanced by adding features such as task exporting, notifications, or even a graphical user interface (GUI).

Q: Is this application suitable for production use?
A: No, this project is mainly intended for educational purposes and practice rather than real-world production use.

Known Limitations

- The application only runs through a **command-line interface** and does not include a GUI.
- User input validation is basic and limited.
- The system relies on **JSON files** instead of a full database system.
